DESCRIPTORS: *Concrete, *Cements, Polymers,
Plasticity, Elasticity, Mechanical properties.

By changing the ratio of polymer and cement and selec-
ting a suitable polymer a whole gamut of materials can
be produced, from brittle concretes to resilient ma-
terials whose deformation properties approach those of
cured rubber. Such fine-grained polymer-cement con-
cretes with low elastic moduli can be widely used as
constructional adhesives, various types of putty, and
even as building materials resistant to impact and vi-
bration effects. (Author)
